Overview

The backplane is a high-performance economical solution for users who has sufficient SAS host ports on MB or RAID/HBA to accommodate 4 disks in the system. The hybrid backplane is supporting state-of-the-art SAS4 22.5Gbps HDD/SSD and backward compatible with SAS3 12Gbps, SAS 6Gbps, SATA 6Gps and SATA 3Gps HDD/SSD. The backplane supports 8 pcs of NVMe SSD up to GEN5 through MCIO 4i (Mini Cool Edge IO) interfaces. The MCIO 4i connector could connect to MB, NVMe HBA/RAID or PCIe Retimer Card that supports it.

Basically, the one pcs of SFF-8654 SlimSAS-4i connectors can support up to 4 SAS/SATA disks. 4 of the disk slots are the so called Hybrid ports that can support U.2/U.3 NVMe SSD via MCIO 4i connectors. Please note that the hybrid ports can support either SAS/SATA disk or U.2/U.3 NVMe SSD at a time.

On backplane offer VRM with P3.0-2*3Pin 12V (15A) DC input provide up to 5V (15A) on board to satisfy the power needs of fully loaded for disk drives.

Along with the smart fan control feature, a system alarming feature is also implemented to alert users in case Fan module failure and/or system overheat occurs by illuminating the LED indicator. Users can then inform of issue and take corresponding actions to resolve the issue according to the failure type.

For disk bays management, the backplane supports SGPIO protocol for SAS/SATA disks activity and status indication through SlimSAS connections on the board.

Physical Outlook

Hardware Specification

HOST Facing Interface : SFF-8654 SlimSAS 4i /MCIO_4i

DEVICE Facing Interface : SFF-8639 U.2-SATA/SAS/NVMe SSD

Indicator :

- Indicator :
 - Power LED PD1~PD4: Steady Blue – (When HDD is resent)
 - Dual color (Green/Red) LED D1~D4 for Hard Disk Drive Status (Activity/Failure/Locate)
 - ◆ Activity LED: Blinking Green (When HDD is Access)
 - ◆ Locate LED : Blinking Red (When HDD Fail or Locate)
 - ◆ Fail LED: Steady Red (When HDD Fail or Locate)
- Environment Control:
 - PWM FAN Connector (FAN1) for Cooling system.
 - Temperature Sensor (RTB1) Monitor HDD Bay inside temperature.
 - Buzzer (SUB1) for Over-temperature and FAN fail alerting.
- Connector
 - SFF-8654 SlimSAS 4i 38pin Connector (CN1) for Host Facing Interface (SAS4)
 - MCIO 4i 38Pin (NVME1~NVME4 for Host Facing Interface (NVMe)
 - SFF-8639 U.2 68PIN Connector (DISK1~DISK4 for SATA/SAS4Disk or NVMe SSD).
 - 6Pin Main Power Connector*1(PW1)
- JS1 connector for LED/Mute SW cable connection from Front Panel to Backplane.
- JD1 MCU Programming Header for Programming MCU Firmware

LED Behavior

Disk Bay LED

Blue LED:

Disk Insertion Indicator –

Turned on whenever disk drive is properly installed.

Green LED:

Activity indicator –

Stay off when idle and blinking (~8 Hz) whenever disk drive is being accessed.

RED LED:

Fail and Locate indicator –

Turned steady on when disk failure occurs. Blinking (1 Hz) when locating Disk, RAID rebuild and RAID consistent check.

There are 2 parts of LED Management on the backplane. One is for SAS and another is for NVMe. Please note that the disk slots can only accommodate SAS/SATA or NVMe disk at a time since they share the same disk connector.

For SAS application, The LEDs behave by following SGPIO signal coming through sideband bus inside the SFF-8654 SlimSAS cables. Please refer to Section 2 for SGPIO settings. When SGPIO Jumper setting is enabled the LEDs behave according to the SGPIO signals. When SGPIO is disabled, the RED LEDs (for Locate and Fail) do not behave while the GREEN LEDs (for Activity) behave according to the signal from P11 (READY LED) of the disk connectors.

For NVMe application, The LEDs behave according to the VPP over I2C signals from NVMe host controllers through sideband bus of Oculink or SlimSAS cables. Whenever the NVMe host controller support VPP over I2C, the RED LEDs behave Locate, Fail and Rebuild signals following VPP signals on the I2C bus. The Green LEDs (for Activity) behave according to the signal from P11 (Activity) of the disk connectors.

Examples of NVMe connections to Broadcom RAID/HBA controller. Each pair of VPP over I2C signal supports 2 pieces of NVMe disks LED management. The I2C bus is leaded to odd-number NVMe connector (Oculink or SlimSAS) to manage its corresponding and the following NVMe disks. For example, NVMe1 and NVMe2 LED management signal is form NVMe1 connector's sideband I2C bus, NVMe3 and NVMe4 LED management signal is from NVMe3 connector's sideband I2C bus and ...etc.

System Alarm LED

There are two FAIL LED design on the Backplane to indicate Fan Fail and Over-Temperature. Lead 2.0mm 8-pin header JS1 to front panel for indicating system fault.

Fan Fail:

When any fan module RPM is lower than 75% of the expected speed the Fan Fail is triggered and the Fail LED blinks in 0.5Hz rate. Goes off when the issue is resolved or disappeared.

Overheat:

When the system temperature at the backplane area is going beyond 45°C the Temp Fail triggered and Fail LED blinks in 2Hz rate. Goes off when temperature is going under 45°C.

Overheat & Fan Fail:

Fail LED stays steady on when both events triggered at the same time.

Note:

- ◆ When the system alarm is triggered, the Buzzer beeps along with it and stops beeping when alarm is disappeared.
- ◆ 1 short beep(B—B—B) stands for Fan Fails
- ◆ 2 short beeps(BB—BB—BB) stand for Over-Temperature
- ◆ Press Mute Button to disable buzzer beeping and will be retriggered when either failure occurs again.

IN WIN's Backplane is implemented Smart Fan Control feature by automatically detecting the existences of the Fan Modules and intelligently control the Fan RPM per the system temperature being detected by a thermal sensor (RTB1) on the backplane.

1. Fan module auto-calibration triggered in every system boot. The thermal profile would then be recorded and used until next reboot.
2. Backplane starts fan calibration and calculates the corresponding PWM duty cycle for each level. There are totally 8 speed levels to be sensed and used until next system boot.
3. The 8 levels of fan speed are mapped to the temperature readings detected by thermistor spreading from 25 to 45 °C in 3.75 degree C step.
4. In normal operation, when the system temperature changes to next level, the fan module would change speed accordingly. And, the Fan failure alarm would be triggered when the RPM of the Fan module is dropped lower than 75% of its expected speed.
5. The fan module calibration and thermal profile are as below.
6. When an external PWM source joins, the output PWM duty is determined by comparing the internal calculated PWM and external PWM and then select whichever is higher as the output PWM to the fan modules.

Fan Speed Measurement

$$R_{diff} = \text{Maximum RPM} - \text{Minimum RPM}$$

Cooling Control Policy – 45 Celsius

Firmware Upgrade

The passive backplanes are planted Nuvoton M482 series MCUs for hosting disk LED indication, Fan speed control and system fail alarm. These MCUs are preprogrammed in manufacturing. In most cases, the MCUs are not required to reprogram unless there is issue needed to fix.

How to upgrade firmware?

1. Require Nuvoton ARM Cortex-M4 programming tool. Nu-Me or Nu-Link and install Nuvoton ICP Programming tool software.

2. Connect Nu-Link USB end to a host and the SWD end to Backplane ICE connector for each MCU.

3. Make sure device is connected and select the binary file being programmed and then click on Start button to program firmware.

4. Please refer to http://www.nuvoton.com/resource-files/NuLink_Adapter_User_Manual_EN_V1.01.pdf for more details.
